Try these fixes

1. Run OpenCode without the environment overrides

bash

```
unset HOST BINDHOST
opencode
```

If that works, one of the overrides was interfering with the server configuration.

2. Explicitly set the server hostname

Try:

bash

```
opencode serve --hostname 127.0.0.1
```

If your version doesn't recognize that option, check the supported flags:

bash

```
opencode serve --help
```

3. Check which addresses your environment supports

Run:

bash

```
ip addr
```

If `ip` isn't installed, try:

bash

```
hostname -I
```
